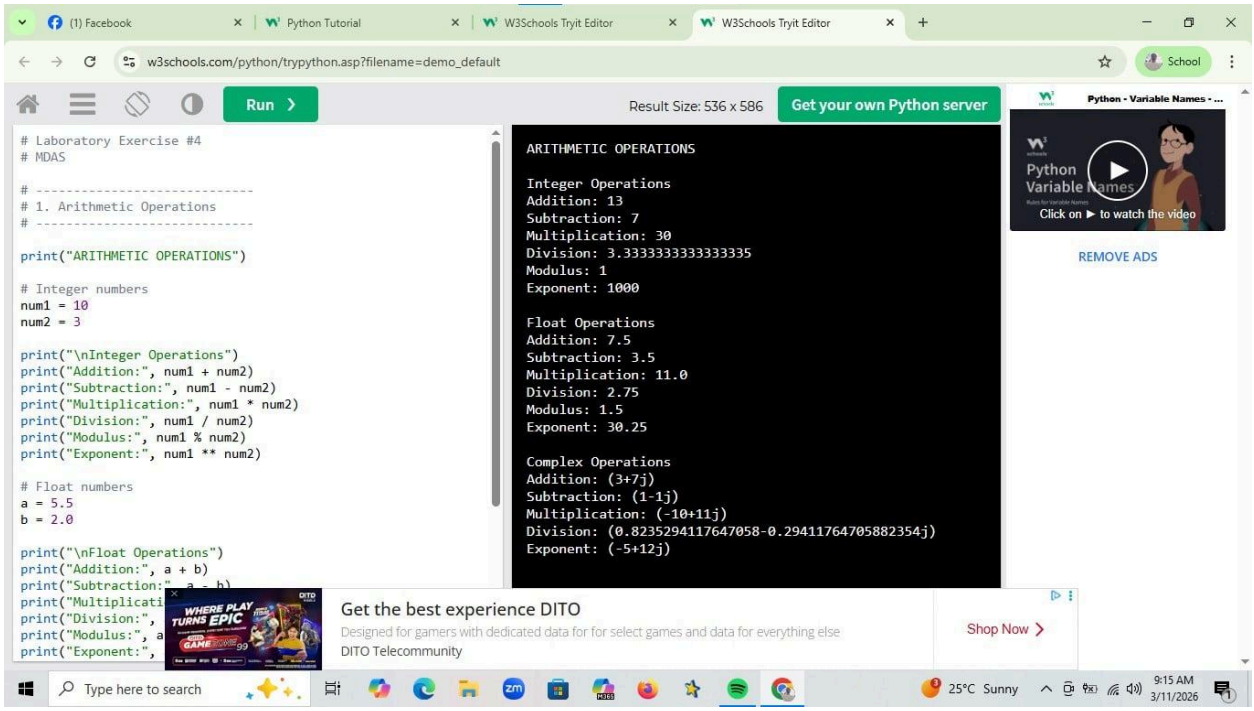
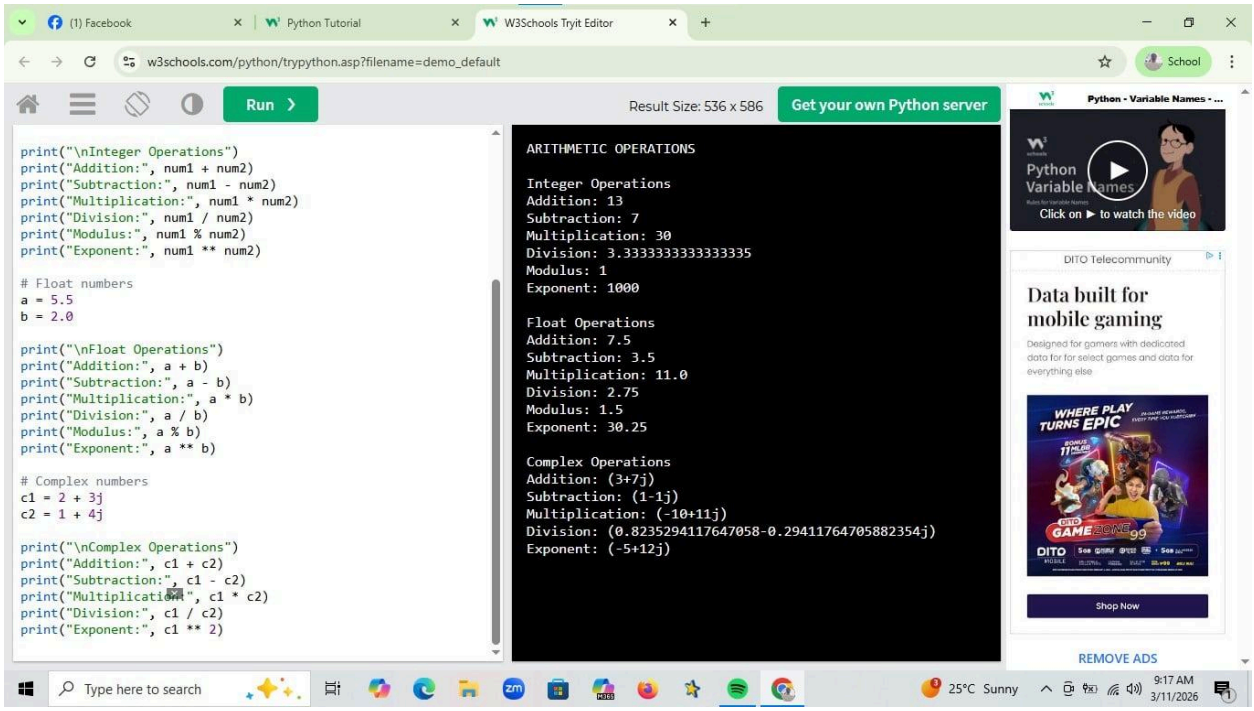
Group Activity- 6 Laboratory Exercise #4

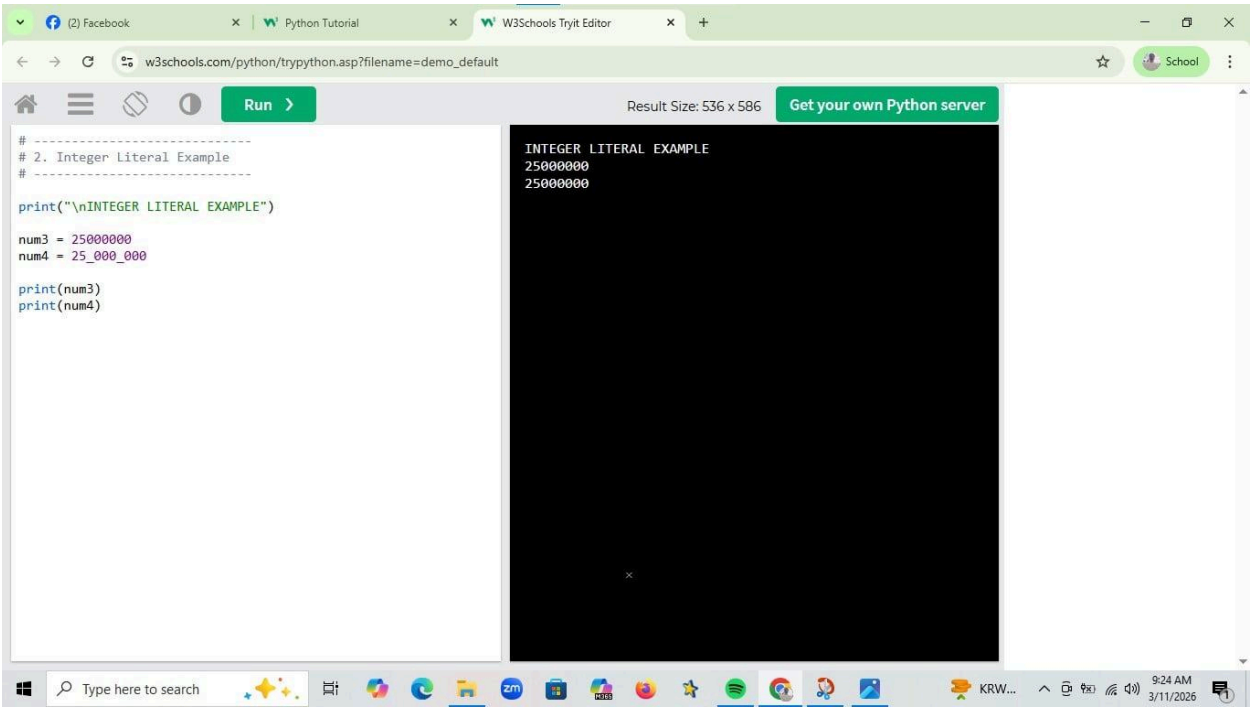
MDAS

#1 Create a Python program to perform arithmetic Operations (Addition, Subtraction, Division, Multiplication, Modulus, Exponent) using two variable numbers for int, float and complex

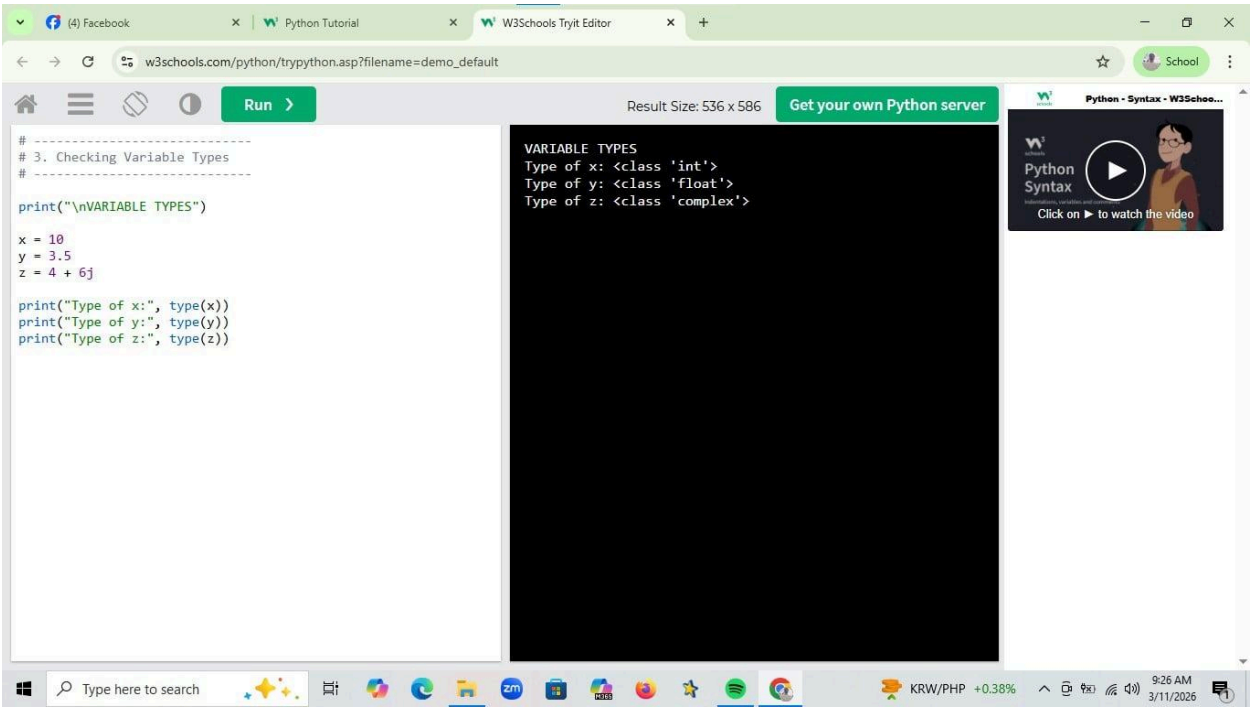




#2 Write a program that creates two variables, num1 and num2. Both num1 and num2 should be assigned the integer literal 25000000, one written with underscores and one without. Print num1 and num2 on two separate lines.



#3 Creating int,float and complex variable then check the type using the Python Code



HERE'S THE COMBINE CODE :
